History of Information Retrieval

Hughes, Simon. "Semantic Product Search – Vector Search for E-Commerce." Conference Presentation at Haystack 2021, https://haystackconf.com/files/slides/haystack2021/Hughes-Haystack_2021_Semantic_Product_Search.pdf, September 29, 2021.

Token based retrieval

Boolean Retrieval

- Queries and documents are represented as bag of words
- Query terms are connected with boolean operators
- Disadvantages:
 - Filtering more than retrieval
 - Terms have same weights
 - No ranking

pictures of kitten playing 

Query Processing (tokenize , stop words, stemming)

["pictures", "of", "kitten", "playing"]

["picture", "kitten", "play"]

picture OR kitten OR play

Which Document is most relevant ?

images of cat playing

video of kitten ..
having fun

kitten sleeping
dog playing in park
.....

IG cooking pictures

score: 1

score: 1

score: 3

TF-IDF

TF-IDF is a measure of originality of a word by comparing the number of times a word appears in a doc with the number of docs the word appears in.

$$\text{TF-IDF} = \text{TF}(t, d) \times \text{IDF}(t)$$

Term frequency

Number of times term t appears in a doc, d

Inverse document frequency

$$\log \frac{1 + \overset{\text{\# of documents}}{n}}{1 + \underset{\text{Document frequency of the term } t}{df(d, t)}} + 1$$

BM25

idf - how popular
is the term in the
corpus?

$$\text{bm25}(d) = \sum_{t \in q, f_{t,d} > 0} \log \left(1 + \frac{N - df_t + 0.5}{df_t + 0.5} \right) \cdot \frac{f_{t,d}}{f_{t,d} + k \cdot \left(1 - b + b \frac{l(d)}{\text{avgdl}} \right)}$$

saturation
curve - limit
influence of tf
on the score

length weighing -
tweak influence of
document length

73

ElasticSearch

— — —

- Open source search engine based on Lucene library
- Supports BM25 and other similarities ([link](#))
- Supports boosting , filtering , phrase match, autocomplete
- Distributed : index shards, replicas

elasticsearch

ElasticSearch Schema

```
{
  "mappings": {
    "properties": {
      "title": {
        "type": "text"
      },
      "description": {
        "type": "text"
      },
      "brand": {
        "type": "keyword"
      },
      "product_type": {
        "type": "keyword"
      },
      "price": {
        "type": "double"
      }
    }
  }
}
```

full text field

regular text field

numeric field

Possible schema for an e-commerce item

ElasticSearch Query

Query: Nike shoes under 100\$

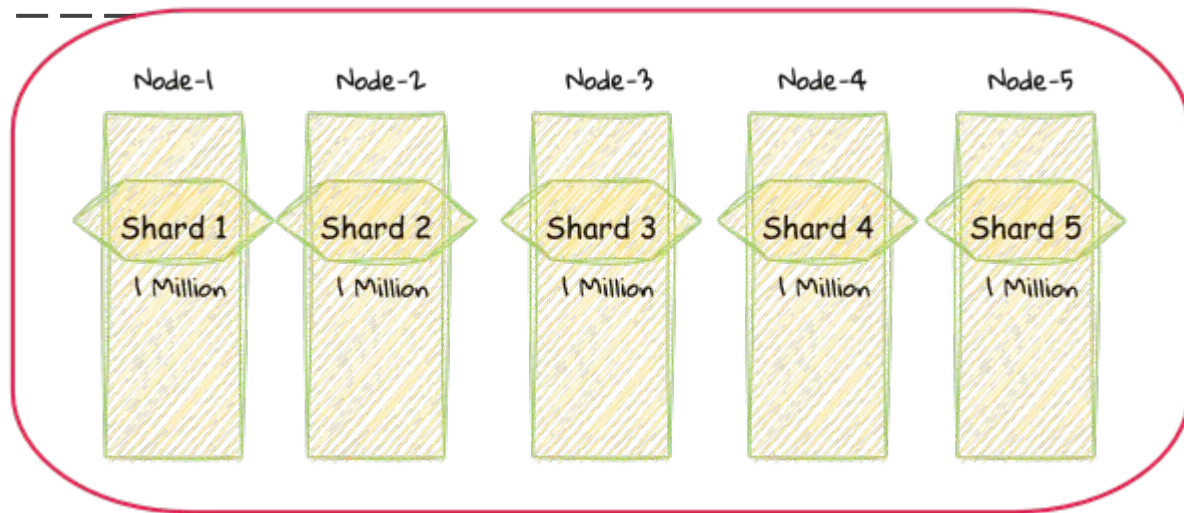

```
{
  "query": {
    "multi_match": {
      "query": "Nike shoe under 100$",
      "fields": ["title^2", "Description^1"]
    },
    "bool": {
      "filter": [
        { "term": { "brand": "nike" } }
      ]
    },
    "filtered": {
      "filter": {
        "range": {
          "price": {
            "lte": 100
          }
        }
      }
    }
  }
}
```

Search for query tokens in title and description
weight matches found in title double

filter items who has brand nike

filter items with price <= 100

Index with multiple shards

- Index can be composed of shards
- Reading / Writing can be faster

Learning to Rank

Red Dress

Original Order

New Order

Learning to Rank
dmlc
XGBoost

Query Intent Features

- product type
- color
- brand

Item Features

- customer score
- price
- product type
- color
- brand

Context Features

- previous queries
- season

Issues with Sparse Representation

— — —

- Lexical GAP: Covid vs Coronavirus vs Omicron variant
- Ambiguity: bank (institution) vs bank (geography)
- Position matters: “river bank” vs “bank river”
- Lack of Contextualized embeddings

She will *park* the car so we can walk in the *park*.

Lab

Jupyter Hub: <https://hub.np.training>

Repo: <https://bit.ly/search-workshop-2022>

Lab 1 Goals

- Explore tokenization and some preprocessing
- Building a simple in-memory retrieval system using BM-25

Embedding Based Retrieval

Dense Embeddings

Word Representation

car: [0.2 , 0.3, 0.7]

automobile: [0.2 , 0.3, 0.7]

Similar concepts have similar embeddings

Regardless of content length, similar items should have similar embeddings

Size of embedding is independent of #tokens

Review Representation

Review 1: 🍦 was great [0.5 , 0.1, ... , 0.6]

Review 2: Chocolate ice cream was the best .. [0.5 , 0.1, ... , 0.5]

Word2Vec

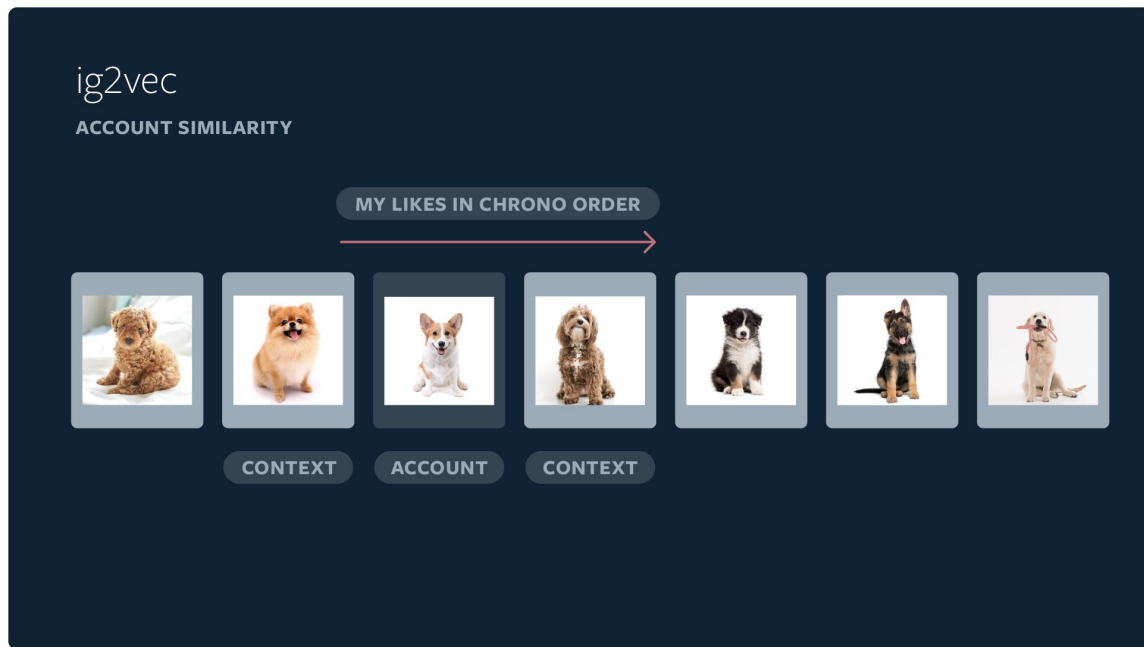

My *clever* *cute* *kitten* is playing with

window size = 2

- Published in 2013
- Represent each word as a dense vector
- Uses a neural network model to capture linguistic concept of words

Instagram: ig2Vec

Bidirectional Encoder Representations from Transformers (BERT)

Input to the model, contains token , segment and position embedding

Image from BERT paper <https://arxiv.org/pdf/1810.04805.pdf>

BERT

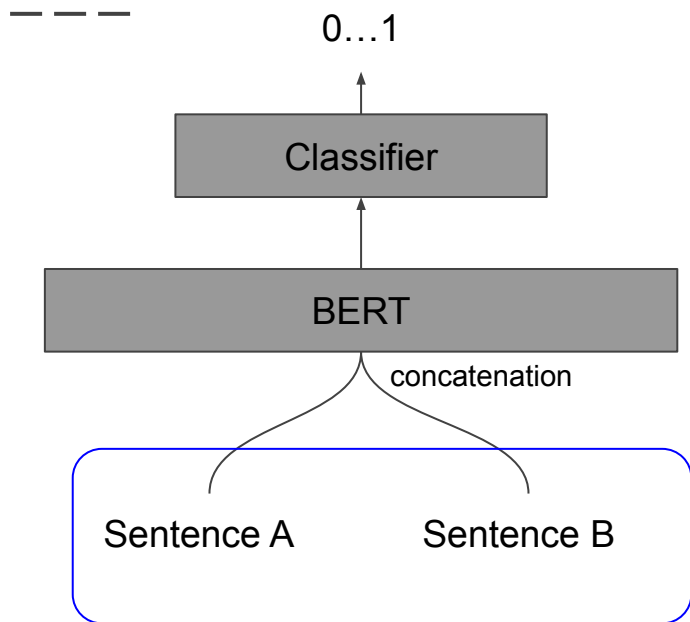

The output of each encoder layer can be used to represent the feature for that token

- BERT is composed of multiple encoders
- There is embedding for each token after each encoder
- Sentence embedding can be created from pooling
- Pooled embeddings are not best for similarity search

Sentence Pair Encoder - Cross-encoder

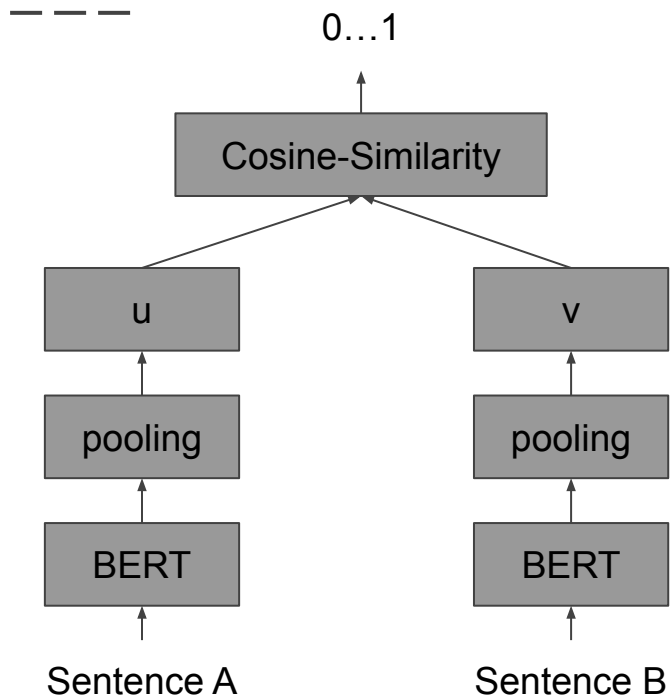

Pros

- Accurate classification

Cons

- Need new encoding for each pair
- Computationally inefficient for information retrieval.

Sentence Pair Encoder - Bi-Encoder

Pros

- Each sentence is encoded separately
- Distance between two sentence embeddings can be measured
- Faster and more computationally efficient

Cons

- Bi-encoders performance is poor compared to cross-encoders for supervised learning problems

Lab

Jupyter Hub: <https://hub.np.training>

Repo: <https://bit.ly/search-workshop-2022>

Lab 2 Goals

— — —

- Explore Text Embedding model
- ANN Retrieval using Milvus

Different types of negatives

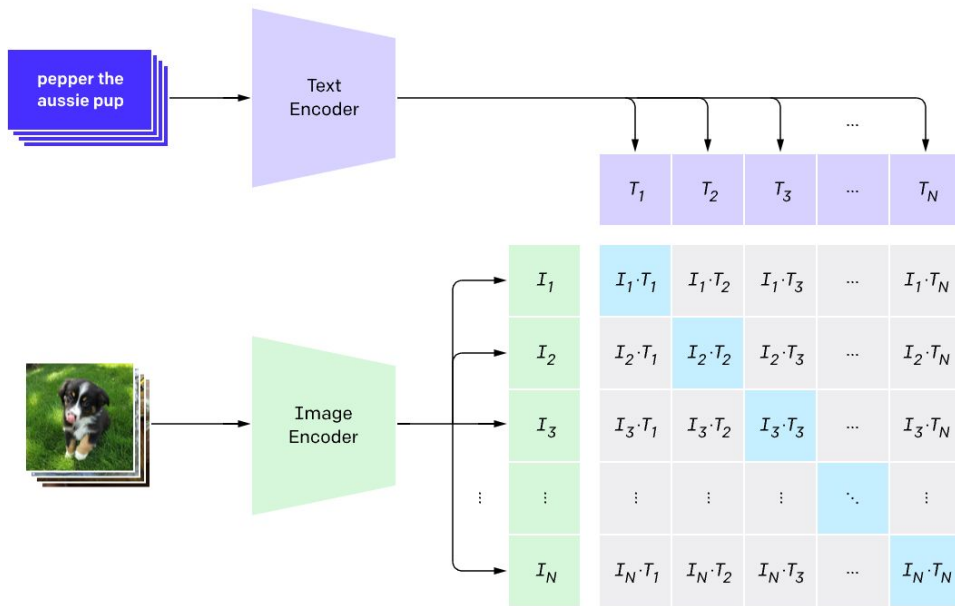

Anchor, Positive Ex, Negative Ex

Multiple Modality: Vision Transformers (ViT)

— — —

- Vision Transformer models like CLIP model uses two encoders (text and image).
- These two models are trained in parallel and optimized via a contrastive loss function
- End result is where you can search by text or image

Encoder can include multiple features

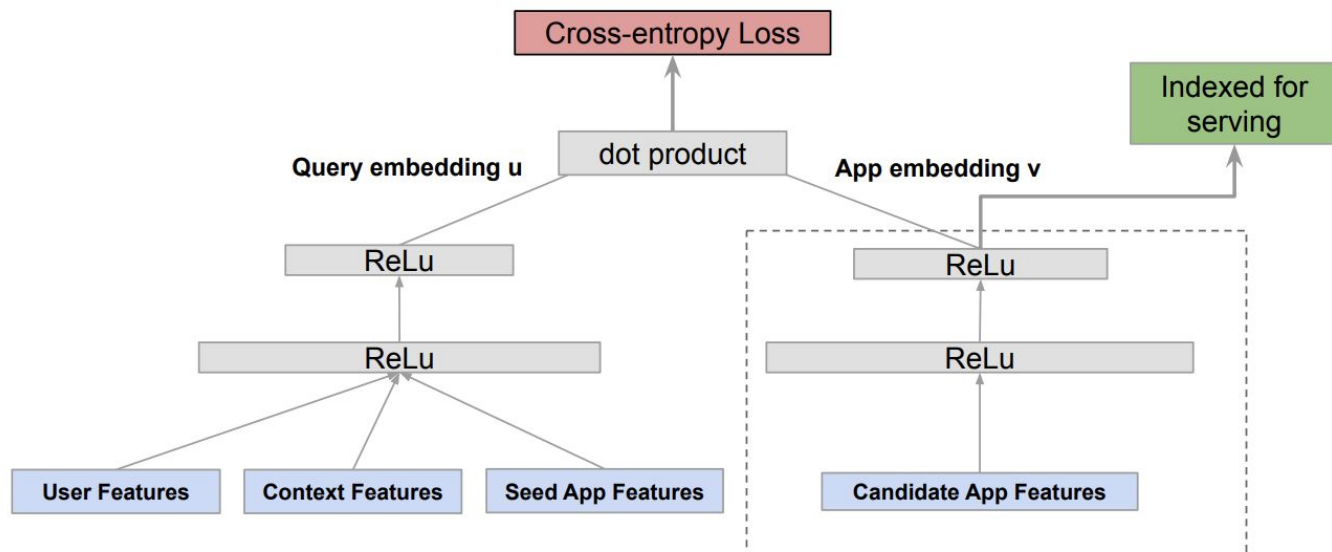

Figure 5: Two-tower model architecture for Google Play app recommendation.

Lab

Jupyter Hub: <https://hub.np.training>

Repo: <https://bit.ly/search-workshop-2022>

Lab 3 Goals

— — —

- Building a simple in-memory retrieval system using a multi-modal model like CLIP

Approximate Nearest Neighbors

In a flat index / no index, our query vector is compared against all the vectors in the database.

Inverted File Index: Building

- Find centroid and create Voronoi Cells
- Number of centroids is determined by **nlist** parameter

Inverted File Index: Building

- Built Voronoi Index with 15 centroids
- Memory usage is not reduced
- But retrieval is faster

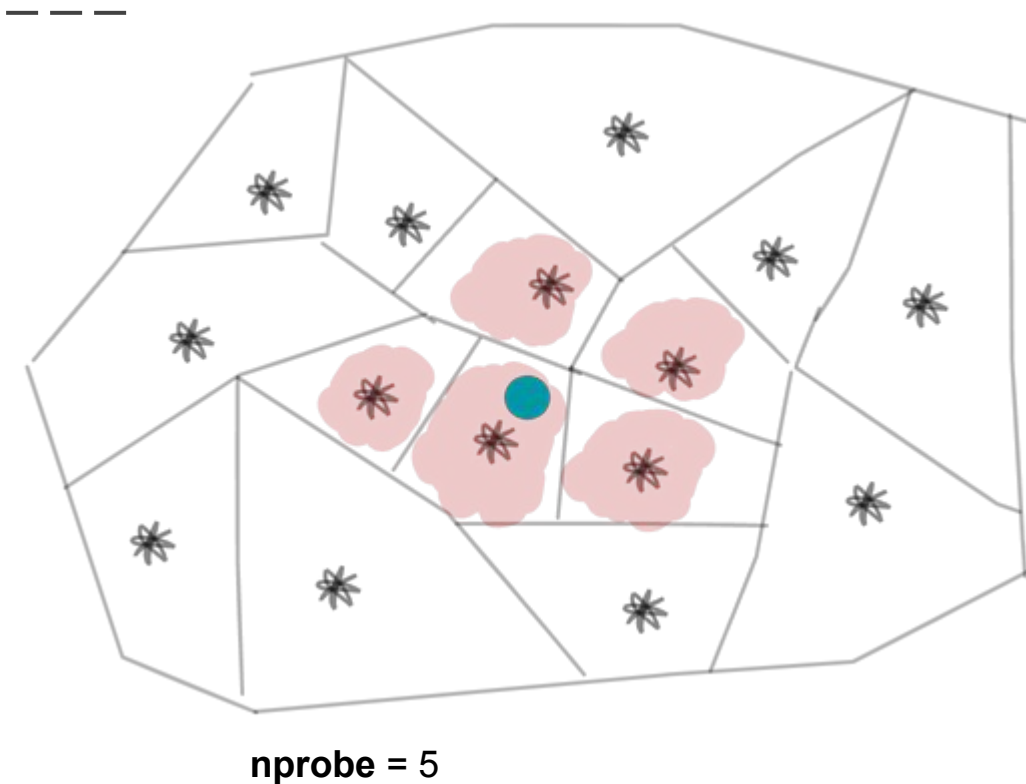

Inverted File Index: Searching

nprobe = 1

- Find the distance between query vector and all the centroids
- Query all the elements inside the n closest cluster determined by **nprobe** parameter

Inverted File Index: Searching

- Increasing the value of **nprobe**, improves recall but increases latency
- If $nprobe = nlist$, similar to flat index

ANN Benchmarks

FAISS

Evaluation Considerations

— — —

- Managed vs Self-hosted
- Performance
- Update Embeddings / Partial Updates
- Metadata Filtering
- Filtering / Hybrid Retrieval
- Plugins

Filtering

Closest 10
candidates don't
meet our filter

Hybrid / Full Retrieval

Supports

elastic

vespa

- In ES, **disjunction** of knn and bm25 match.
- The score of each hit is the sum of the knn and query scores. A boost can be specified

```
POST image-index/_search
{
  "query": {
    "match": {
      "title": {
        "query": "mountain lake",
        "boost": 0.9
      }
    }
  },
  "knn": {
    "field": "image-vector",
    "query_vector": [54, 10, -2],
    "k": 5,
    "num_candidates": 50,
    "boost": 0.1
  },
  "size": 10
}
```

ElasticSearch example of Hybrid Retrieval

Lab

Jupyter Hub: <https://hub.np.training>

Repo: <https://bit.ly/search-workshop-2022>

Lab 4 Goals

— — —

- Build a flat ANN index
- Optimize retrieval by building an IVF Index

Conclusion

Multi Source Retrieval

Spotify Podcast Episode Search

Retrieval from ES + ANN + other sources

Multi Stage Retrieval and Ranking

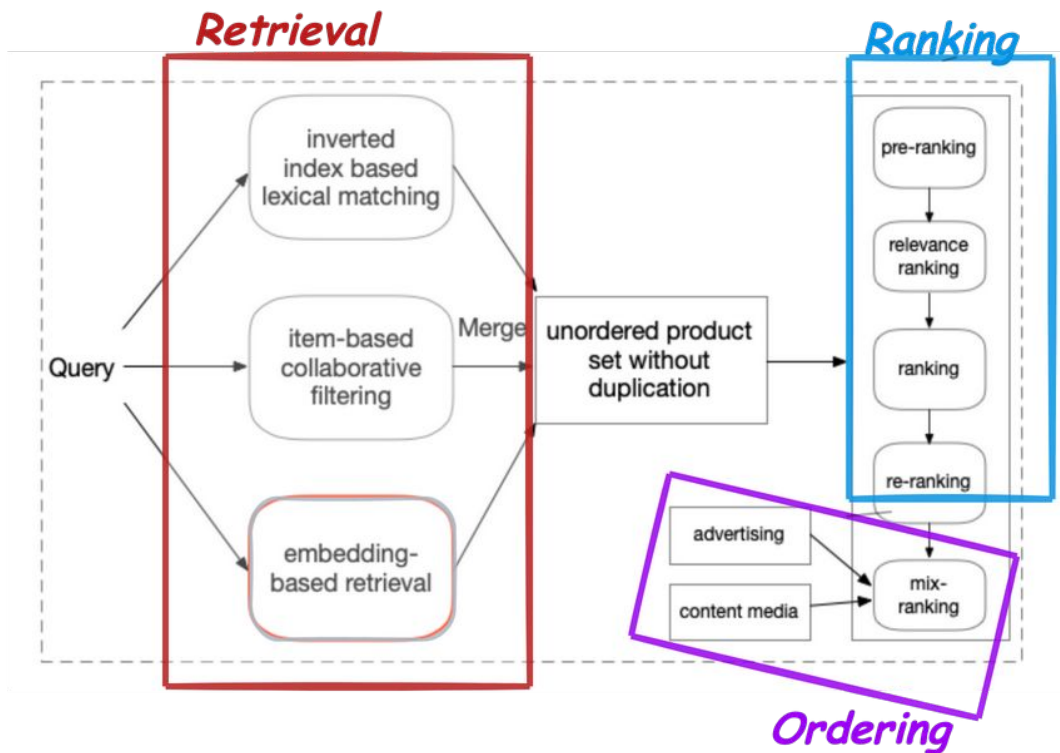

In 2019, Instagram Explore feed was made of

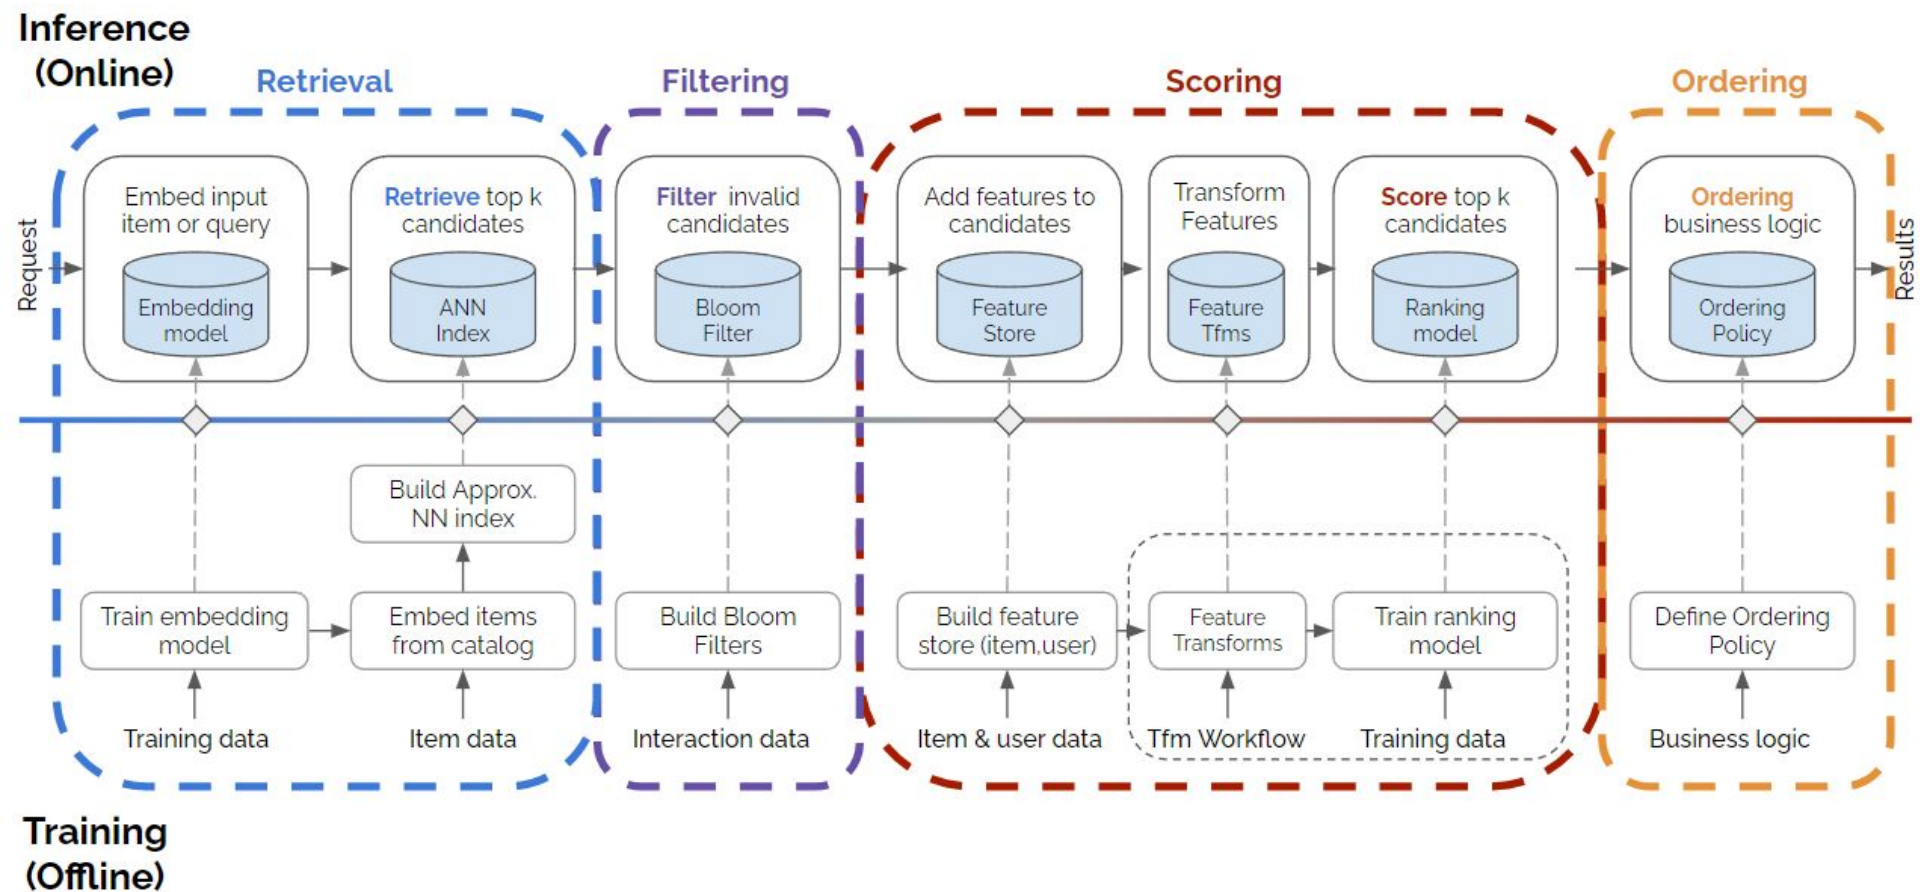

- Sparse Retriever: 500 candidates
- Lightweight NN: 150 → 50
- Deep Neural Network: 50 → 25

Medvedev, Ivan, Haotian Wu, and Taylor Gordon. "Powered by AI: Instagram's Explore Recommender System." Powered by AI: Instagram's Explore recommender system, November 2019.

Overview of Taobao Search

	Retrieval	Filtering	Scoring	Ordering
Music Discovery	Find similar songs based on nearest neighbour search	Remove tracks users listened before	Predict likelihood that a user will listen to a song	Trade-Off between score, similarity, BPM, etc
Social Media	Find new posts in user's network	Remove posts from blocked and muted users	Predict likelihood that a user will interact with it	Change order that adjust posts are from different authors
Online Store	Find items which are usually co-purchased	Remove items which are out of stock	Predict likelihood that a user will purchase an item	Reorder items based on price points
Streaming Service	Find items based on different rows/shelves/topics	Remove items which are not available for user's country	Predict user's stream time per item	Organize recommendations to fit genre distributions

Zipfian Distribution of Web Traffic

- Most web platforms traffic follows a zipfian distribution
- Frequent queries / head traffic can be cached
-

Enhancing Sparse Index: Doc2Query / Doc2T5Query

- Use a causal language model to generate additional text to add to documents when indexing.
- At retrieval time, use BM25

Benchmarking

— — —

Dataset	BM25	Dense (TAS-B)		BM25 on docT5query	BM25 + Cross Encoder
Baseline (MS MARCO)	0.228	0.408	—	<u>0.338</u>	<u>0.413</u>
Quora	0.789	0.835	—	<u>0.802</u>	<u>0.825</u>
DBPedia	0.313	0.384	—	<u>0.331</u>	<u>0.409</u>
—	—	—	—	—	—
TREC-COVID (Medical)	0.656	0.481	—	<u>0.713</u>	<u>0.757</u>
Signal-1M (Tweets)	0.330	0.289	—	<u>0.325</u>	<u>0.338</u>

Do models trained on MS MARCO work for different datasets ?

Dense Retrieval performs well on similar domain

COVID/Tweets are out of domain

BM25 + DR perform best

Cost to Serve

— — —

Model	Dimension	Latency (CPU)	Latency (GPU)	Index Size
BM-25	—	20 ms	—	0.4 GB
docT5Query	—	30 ms	—	0.4 GB
Dense Embedding Passage Retrieval	768	230 ms	19 ms	3 GB
BM25 + Cross Encoder	—	6100 ms	450 ms	0.4 GB

Estimated average
retrieval latency and
index sizes

Dataset: DBPedia (1
million docs)

Lower Latency and
Index Size is
preferred

CPU: 8 core Intel
Xeon Platinum 8168
CPU @ 2.70GHz

GPU: 1 Nvidia Tesla
V100
